Divyanshee Verma

Backend Developer @ The World Bank | IIT Patna’25

Mumbai, Maharashtra, India

Summary

I am a software engineer with a strong interest in data and development, focused on building scalable and practical solutions to real-world problems.Currently, I work with the World Bank in collaboration with the Government of Maharashtra, where I contributed to developing a full-stack dashboard used by 50,000+ officers to manage and streamline large-scale registration workflows, improving efficiency and accessibility.Previously, as a Data Science Intern at Nexus Software, I worked on real-world datasets to build and improve machine learning models for tasks such as fraud detection and medical diagnosis. I also optimized data pipelines and improved model performance through data analysis and feature engineering.I have hands-on experience building full-stack applications and working with machine learning systems, including computer vision-based solutions, with a focus on reliability and scalability.I enjoy working at the intersection of software development and data to build impactful products and continuously explore better ways to solve complex problems.Open to opportunities in software engineering, data-driven development, and product-focused roles.

Experience

The World Bank

Backend Developer

October 2025 - February 2026 (5 months)

Mumbai

Working on MahaVISTAAR-AI, an AI-driven agricultural platform delivering actionable insights and advisory services to farmers across Maharashtra.

• Led development of a responsive React. js-based officer dashboard enabling real-time monitoring of downloads of MahaVISTAAR-AI app, usage, and activity across districts, talukas, and villages, improving operational visibility for 50,000+ users

• Built frontend components for a data ingestion portal (MahaVISTAAR-AI) and ensured seamless integration with backend systems, focusing on performance, usability, and scalable data workflows
• Conducted in-depth data analysis for Direct Benefit Transfer (DBT) Phase 1 on large-scale beneficiary and transaction datasets, identifying trends, inconsistencies, and data quality issues to improve transparency and validation
• Developed and integrated a computer vision solution using Python and OpenCV to detect photo-of-photo fraud in the DBT verification pipeline, enhancing document authenticity checks and reducing fraud risk

Nexus Software
Data Science Intern
December 2023 - March 2024 (4 months)

• Built machine learning models for credit card fraud detection and breast cancer classification, improving predictive performance through feature engineering and data analysis
• Processed and analyzed large-scale datasets using pandas and scikit-learn to extract actionable insights
• Developed an interactive Power BI dashboard for fraud detection analysis, enabling visualization of transaction patterns, anomalies, and key risk indicators for better decision-making
• Optimized data processing and model training workflows using TensorFlow and Google Colab, improving computational efficiency
• Applied data-driven approaches to solve real-world predictive modeling problems

Education

Indian Institute of Technology, Patna
Bachelor of Technology, Biochemical Engineering · (2021 - 2025)

D.A.V. Public School BSEB Colony
10th
